

# Package: hetGP (via r-universe)

September 5, 2024

**Type** Package

**Title** Heteroskedastic Gaussian Process Modeling and Design under Replication

**Version** 1.1.7

**Date** 2024-09-04

**Description** Performs Gaussian process regression with heteroskedastic noise following the model by Binois, M., Gramacy, R., Ludkovski, M. (2016) <[doi:10.48550/arXiv.1611.05902](https://doi.org/10.48550/arXiv.1611.05902)>, with implementation details in Binois, M. & Gramacy, R. B. (2021) <[doi:10.18637/jss.v098.i13](https://doi.org/10.18637/jss.v098.i13)>. The input dependent noise is modeled as another Gaussian process. Replicated observations are encouraged as they yield computational savings. Sequential design procedures based on the integrated mean square prediction error and lookahead heuristics are provided, and notably fast update functions when adding new observations.

**License** LGPL

**LazyData** FALSE

**Depends** R (>= 2.10),

**Imports** Rcpp (>= 0.12.3), MASS, methods, DiceDesign

**LinkingTo** Rcpp

**Suggests** knitr, monomvn, lhs, colorspace

**VignetteBuilder** knitr

**RoxygenNote** 7.3.2

**NeedsCompilation** yes

**Author** Mickael Binois [aut, cre], Robert B. Gramacy [aut]

**Maintainer** Mickael Binois <[mickael.binois@inria.fr](mailto:mickael.binois@inria.fr)>

**Index** 89

---

*allocate\_mult*                    *Allocation of replicates on existing designs*

---

### Description

Allocation of replicates on existing design locations, based on (29) from (Ankenman et al, 2010)

### Usage

```
allocate_mult(model, N, Wijs = NULL, use.Ki = FALSE)
```

### Arguments

|        |  |
|--------|--|
| model  | hetGP model  |
| N      | total budget of replication to allocate  |
| Wijs   | optional previously computed matrix of Wijs, see <a href="#">Wij</a>   |
| use.Ki | should Ki from model be used? Using the inverse of C (covariance matrix only, without noise, using <a href="#">ginv</a> ) is also possible |

### Value

vector with approximated best number of replicates per design

### References

ato

*Assemble To Order (ATO) Data and Fits*

---

## Description

A batch design-evaluated ATO data set, random partition into training and testing, and fitted **hetGP** model; similarly a sequentially designed adaptive horizon data set, and associated fitted **hetGP** model

## Usage

```
data(ato)
```

## Format

Calling `data(ato)` causes the following objects to be loaded into the namespace.

$X$  2000x8 matrix of inputs coded from 1,...,20 to the unit 8-cube; original inputs can be recreated as  $X*19 + 1$

Z 2000x10 matrix of normalized outputs obtained in ten replicates at each of the 2000 inputs X.  
Original outputs can be obtained as  $Z \cdot \sqrt{Zv} + Zm$

Zm scalar mean used to normalize Z

Zv scalar variance used to normalize Z

train vector of 1000 rows of X and Z selected for training

Xtrain 1000x8 matrix obtained as a random partition of X

Ztrain length 1000 list of vectors containing the selected (replicated) observations at each row of Xtrain

mult the length of each entry of Ztrain; same as `unlist(lapply(Ztrain, length))`

kill a logical vector indicating which rows of Xtrain for which all replicates of Z are selected for Ztrain; same as `mult == 10`

Xtrain.out 897x8 matrix comprised of the subset of X where not all replicates are selected for training; i.e., those for which `kill == FALSE`

Ztrain.out list of length 897 containing the replicates of Z not selected for Ztrain

nc noiseControl argument for `mleHetGP` call

out `mleHetGP` model based on Xtrain and Ztrain using `noiseControl=nc`

Xtest 1000x8 matrix containing the other partition of X of locations not selected for training

Ztest 1000x10 matrix of responses from the partition of Z not selected for training

ato.a 2000x9 matrix of sequentially designed inputs (8) and outputs (1) obtained under an adaptive horizon scheme

Xa 2000x8 matrix of coded inputs from ato.a as `(ato.a[,1:8]-1)/19`

Za length 2000 vector of outputs from ato.a as `(ato.a[,9] - Zm)/sqrt(Zv)`

out.a `mleHetGP` model based on Xa and Za using `noiseControl=nc`

## Details

The assemble to order (ATO) simulator (Hong, Nelson, 2006) is a queuing simulation targeting inventory management scenarios. The setup is as follows. A company manufactures  $m$  products. Products are built from base parts called items, some of which are “key” in that the product cannot be built without them. If a random request comes in for a product that is missing a key item, a replenishment order is executed, and is filled after a random period. Holding items in inventory is expensive, so there is a balance between inventory costs and revenue. Hong & Nelson built a Matlab simulator for this setup, which was subsequently reimplemented by Xie, et al., (2012).

Binois, et al (2018a) describe an out-of-sample experiment based on this latter implementation in its default (Hong & Nelson) setting, specifying item cost structure, product makeup (their items) and revenue, distribution of demand and replenishment time, under target stock vector inputs  $b \in \{1, \dots, 20\}^8$  for eight items. They worked with 2000 random uniform input locations (X), and ten replicate responses at each location (Z). The partition of 1000 training data points (Xtrain and Ztrain) and 1000 testing (Xtest and Ztest) sets provided here is an example of one that was used for the Monte Carlo experiment in that paper. The elements Xtrain.out and Ztrain.out comprise of replicates from the training inputs which were not used in training, so may be used for out-of-sample testing. For more details on how the partitions were build, see the code in the examples section below.

Binois, et al (2018b) describe an adaptive lookahead horizon scheme for building a sequential design  $(X_a, Z_a)$  of size 2000 whose predictive performance, via proper scores, is almost as good as the approximately 5000 training data sites in each of the Monte Carlo repetitions described above. The example code below demonstrates this via out-of-sample predictions on  $X_{test}$  (measured against  $Z_{test}$ ) when  $X_{train}$  and  $Z_{train}$  are used compared to those from  $X_a$  and  $Z_a$ .

### Note

The `mleHetGP` output objects were build with `return.matrices=FALSE` for more compact storage. Before these objects can be used for calculations, e.g., prediction or design, these covariance matrices need to be rebuilt with `rebuild`. The generic `predict` method will call `rebuild` automatically, however, some of the other methods will not, and it is often more efficient to call `rebuild` once at the outset, rather than for every subsequent `predict` call

## End(Not run)

```

**Description**

Data from a Bayes factor MCMC-based simulation experiment comparing Student-t to Gaussian errors in an RJ-based Laplace prior Bayesian linear regression setting

**Usage**

```
data(ato)
```

**Format**

Calling `data(bfs)` causes the following objects to be loaded into the namespace.

`bfs.exp` 20x11 `data.frame` whose first column is  $\theta$ , indicating the mean parameter of an exponential distribution encoding the prior of the Student-t degrees of freedom parameter  $\nu$ . The remaining ten columns comprise of Bayes factor evaluations under that setting

`bfs.gamma` 80x7 `data.frame` whose first two columns are  $\beta$  and  $\alpha$ , indicating the second and first parameters to a Gamma distribution encoding the prior of the Student-t degrees of freedom parameters  $\nu$ . The remaining five columns comprise of Bayes factor evaluations under those settings

**Details**

Gramacy & Pantaleo (2010), Sections 3-3-3.4, describe an experiment involving Bayes factor (BF) calculations to determine if data are leptokurtic (Student-t errors) or not (simply Gaussian) as a function of the prior parameterization on the Student-t degrees of freedom parameter  $\nu$ . Franck & Gramacy (2018) created a grid of hyperparameter values in  $\theta$  describing the mean of an Exponential distribution, evenly spaced in  $\log_{10}$  space from  $10^{-3}$  to  $10^6$  spanning “solidly Student-t” (even Cauchy) to “essentially Gaussian” in terms of the mean of the prior over  $\nu$ . For each  $\theta$  setting on the grid they ran the Reversible Jump (RJ) MCMC to approximate the BF of Student-t over Gaussian by feeding in sample likelihood evaluations provided by `monomvn`’s `blasso` to compute the BF. In order to understand the Monte Carlo variability in those calculations, ten replicates of the BFs under each hyperparameter setting were collected. These data are provided in `bfs.exp`.

A similar, larger experiment was provided with  $\nu$  under a Gamma prior with parameters  $\alpha$  and  $\beta \equiv \theta$ . In this higher dimensional space, a Latin hypercube sample of size eighty was created, and five replicates of BFs were recorded. These data are provided in `bfs.gamma`.

The examples below involve `mleHetTP` fits (Chung, et al., 2018) to these data and a visualization of the predictive surfaces thus obtained. The code here follows an example provided, with more detail, in `vignette("hetGP")`

**Note**

For code showing how these BFs were calculated, see supplementary material from Franck & Gramacy (2018)

```

---

compareGP

*Likelihood-based comparison of models*

---

## Description

Compare two models based on the log-likelihood for hetGP and homGP models

## Usage

```
compareGP(model1, model2)
```

## Arguments

model1, model2    hetGP or homGP models

## Value

Best model based on the likelihood, first one in case of a tie

## Note

If comparing homoskedastic and heteroskedastic models, the un-penalised likelihood is used for the later, see e.g., (Binois et al. 2017+).

```

## Arguments

|       |  |
|-------|--|
| X1    | matrix of design locations, one point per row  |
| X2    | matrix of design locations if correlation is calculated between X1 and X2 (otherwise calculated between X1 and itself) |
| theta | vector of lengthscale parameters (either of size one if isotropic or of size d if anisotropic)                         |
| type  | one of "Gaussian", "Matern5_2", "Matern3_2"  |

## Details

Definition of univariate correlation function and hyperparameters:

- "Gaussian":  $c(x, y) = \exp(-(x - y)^2 / \theta)$
- "Matern5\_2":  $c(x, y) = (1 + \sqrt{5} / \theta * \text{abs}(x - y) + 5 / (3 * \theta^2)(x - y)^2) * \exp(-\sqrt{5} * \text{abs}(x - y) / \theta)$
- "Matern3\_2":  $c(x, y) = (1 + \sqrt{3} / \theta * \text{abs}(x - y)) * \exp(-\sqrt{3} * \text{abs}(x - y) / \theta)$

Multivariate correlations are product of univariate ones.

crit\_cSUR

*Contour Stepwise Uncertainty Reduction criterion***Description**

Computes cSUR infill criterion

**Usage**

```
crit_cSUR(x, model, thres = 0, preds = NULL)
```

**Arguments**

|       |   |
|-------|---|
| x     | matrix of new designs, one point per row (size n x d)                             |
| model | homGP or hetGP model, including inverse matrices                                  |
| thres | for contour finding   |
| preds | optional predictions at x to avoid recomputing if already done (must contain cov) |

**References**

filled.contour(matrix(critgrid, ngrid), color.palette = terrain.colors, main = "cSUR criterion")

```

---

crit\_EI

*Expected Improvement criterion*

---

### Description

Computes EI for minimization

### Usage

```
crit_EI(x, model, cst = NULL, preds = NULL)
```

### Arguments

|       |   |
|-------|---|
| x     | matrix of new designs, one point per row (size n x d)                     |
| model | homGP or hetGP model, or their TP equivalents, including inverse matrices |
| cst   | optional plugin value used in the EI, see details                         |
| preds | optional predictions at x to avoid recomputing if already done            |

### Details

cst is classically the observed minimum in the deterministic case. In the noisy case, the min of the predictive mean works fine.

### Note

This is a beta version at this point.

```

---

crit\_IMSPE

*Sequential IMSPE criterion*

---

### Description

Compute the integrated mean square prediction error after adding a new design

### Usage

```
crit_IMSPE(x, model, id = NULL, Wijs = NULL)
```

### Arguments

|       |   |
|-------|---|
| x     | matrix for the new design (size 1 x d)  |
| model | homGP or hetGP model, including inverse matrices  |
| id    | instead of providing x, one can provide the index of a considered existing design             |
| Wijs  | optional previously computed matrix of Wijs, to avoid recomputing it; see <a href="#">Wij</a> |

### Details

The computations are scale free, i.e., values are not multiplied by  $\hat{\nu}$  from homGP or hetGP. Currently this function ignores the extra terms related to the estimation of the mean.

**See Also**

```

---

crit\_logEI

*Logarithm of Expected Improvement criterion*

---

## Description

Computes log of EI for minimization, with improved stability with respect to EI

## Usage

```
crit_logEI(x, model, cst = NULL, preds = NULL)
```

## Arguments

|       |   |
|-------|---|
| x     | matrix of new designs, one point per row (size n x d)   |
| model | homGP or hetGP model, or their TP equivalents, including inverse matrices. For TP models, the computation is using the one from regular EI. |
| cst   | optional plugin value used in the EI, see details   |
| preds | optional predictions at x to avoid recomputing if already done  |

## Details

cst is classically the observed minimum in the deterministic case. In the noisy case, the min of the predictive mean works fine.

## Note

This is a beta version at this point.

```

---

crit\_optim                      *Criterion optimization*

---

### Description

Search for the best value of available criterion, possibly using a h-steps lookahead strategy to favor designs with replication

### Usage

```
crit_optim(
  model,
  crit,
  ...,
  h = 2,
  Xcand = NULL,
  control = list(multi.start = 10, maxit = 100),
  seed = NULL,
  ncores = 1
)
```

### Arguments

|         |  |
|---------|--|
| model   | homGP or hetGP model   |
| crit    | considered criterion, one of "crit_cSUR", "crit_EI", "crit_ICU", "crit_MCU" and "crit_tmSE". Note that crit_IMSPE has its dedicated method, see <a href="#">IMSPE_optim</a> .  |
| ...     | additional parameters of the criterion   |
| h       | horizon for multi-step ahead framework. The decision is made between: <ul style="list-style-type: none"> <li>• sequential crit search starting by a new design (optimized first) then adding h replicates</li> <li>• sequential crit searches starting by 1 to h replicates before adding a new point</li> </ul> <p>Use <math>h = 0</math> for the myopic criterion, i.e., not looking ahead.</p>        |
| Xcand   | optional discrete set of candidates (otherwise a maximin LHS is used to initialize continuous search)  |
| control | list in case Xcand == NULL, with elements multi.start, to perform a multi-start optimization based on <a href="#">optim</a> , with maxit iterations each. Also, tol_dist defines the minimum distance to an existing design for a new point to be added, otherwise the closest existing design is chosen. In a similar fashion, tol_dist is the minimum relative change of crit for adding a new design. |
| seed    | optional seed for the generation of LHS designs with <a href="#">maximinSA_LHS</a>   |
| ncores  | number of CPU available (> 1 mean parallel TRUE), see <a href="#">mclapply</a>   |

## Details

When looking ahead, the kriging believer heuristic is used, meaning that the non-observed value is replaced by the mean prediction in the update.

## Value

list with elements:

- par: best first design,
- value: criterion h-steps ahead starting from adding par,
- path: list of elements list(par, value, new) at each step h

---

crit\_qEI

*Parallel Expected improvement*

---

### Description

Fast approximated batch-Expected Improvement criterion (for minimization)

### Usage

```
crit_qEI(x, model, cst = NULL, preds = NULL)
```

### Arguments

|       |   |
|-------|---|
| x     | matrix of new designs representing the batch of q points, one point per row (size q x d)                                    |
| model | homGP or hetGP model, including inverse matrices.   |
| cst   | optional plugin value used in the EI, see details   |
| preds | optional predictions at x to avoid recomputing if already done (must include the predictive covariance, i.e., the cov slot) |

## Details

cst is classically the observed minimum in the deterministic case. In the noisy case, the min of the predictive mean works fine.

## Note

This is a beta version at this point. It may work for for TP models as well.

|-----------|---------------------------|
| find_reps | <i>Data preprocessing</i> |
|-----------|---------------------------|

---

**Description**

Prepare data for use with [mleHetGP](#), in particular to find replicated observations

**Usage**

```
find_reps(
  X,
  Z,
  return.Zlist = TRUE,
  rescale = FALSE,
  normalize = FALSE,
  inputBounds = NULL
)
```

**Arguments**

|                           |  |
|---------------------------|--|
| <code>X</code>            | matrix of design locations, one point per row  |
| <code>Z</code>            | vector of observations at <code>X</code>   |
| <code>return.Zlist</code> | to return <code>Zlist</code> , see below   |
| <code>rescale</code>      | if TRUE, the inputs are rescaled to the unit hypercube   |
| <code>normalize</code>    | if TRUE, the outputs are centered and normalized   |
| <code>inputBounds</code>  | optional matrix of known boundaries in original input space, of size 2 times <code>ncol(X)</code> . If not provided, and <code>rescale == TRUE</code> , it is estimated from the data. |

**Details**

Replicates are searched based on character representation, using [unique](#).

**Value**

A list with the following elements that can be passed to the main fitting functions, e.g., [mleHetGP](#) and [mleHomGP](#)

- `X0` matrix with unique designs locations, one point per row,
- `Z0` vector of averaged observations at `X0`,
- `mult` number of replicates at `X0`,
- `Z` vector with all observations, sorted according to `X0`,
- `Zlist` optional list, each element corresponds to observations at a design in `X0`,
- `inputBounds` optional matrix, to rescale back to the original input space,
- `outputStats` optional vector, with mean and variance of the original outputs.

**Examples**

```
##-----
## Find replicates on the motorcycle data
##-----
## motorcycle data
library(MASS)
X <- matrix(mcycle$times, ncol = 1)
Z <- mcycle$accel

data_m <- find_reps(X, Z)

# Initial data
plot(X, Z, ylim = c(-160, 90), ylab = 'acceleration', xlab = "time")
# Display mean values
points(data_m$X0, data_m$Z0, pch = 20)
```

---

|         |                      |
|---------|----------------------|
| horizon | <i>Adapt horizon</i> |
|---------|----------------------|

---

### Description

Adapt the look-ahead horizon depending on the replicate allocation or a target ratio

### Usage

```
horizon(  
  model,  
  current_horizon = NULL,  
  previous_ratio = NULL,  
  target = NULL,  
  Wijs = NULL  
)
```

### Arguments

|                 |  |
|-----------------|--|
| model           | hetGP or homGP model   |
| current_horizon | horizon used for the previous iteration, see details                                 |
| previous_ratio  | ratio before adding the previous new design  |
| target          | scalar in ]0,1] for desired n/N  |
| Wijs            | optional previously computed matrix of $W_{ij}$ , see <a href="#">W<sub>ij</sub></a> |

### Details

If target is provided, along with previous\_ratio and current\_horizon:

- the horizon is increased by one if more replicates are needed but a new ppint has been added at the previous iteration,
- the horizon is decreased by one if new points are needed but a replicate has been added at the previous iteration,
- otherwise it is unchanged.

If no target is provided, [allocate\\_mult](#) is used to obtain the best allocation of the existing replicates, then the new horizon is sampled from the difference between the actual allocation and the best one, bounded below by 0. See (Binois et al. 2017).

### Value

randomly selected horizon for next iteration (adpative) if no target is provided, otherwise returns the update horizon value.

---

 IMSPE

---

*Integrated Mean Square Prediction Error*

---

## Description

IMSPE of a given design

## Usage

```
IMSPE(
  X,
  theta = NULL,
  Lambda = NULL,
  mult = NULL,
  covtype = NULL,
  nu = NULL,
  eps = sqrt(.Machine$double.eps)
)
```

## Arguments

|         |  |
|---------|--|
| X       | hetGP or homGP model. Alternatively, one can provide a matrix of unique designs considered |
| theta   | lengthscales   |
| Lambda  | diagonal matrix for the noise  |
| mult    | number of replicates at each design  |
| covtype | either "Gaussian", "Matern3_2" or "Matern5_2"  |
| nu      | variance parameter   |
| eps     | numerical nugget   |

## Details

One can provide directly a model of class hetGP or homGP, or provide X and all other arguments

IMSPE\_optim

*IMSPE optimization***Description**

Search for the best value of the IMSPE criterion, possibly using a h-steps lookahead strategy to favor designs with replication

**Usage**

```
IMSPE_optim(
  model,
  h = 2,
  Xcand = NULL,
  control = list(tol_dist = 1e-06, tol_diff = 1e-06, multi.start = 20, maxit = 100),
  Wijs = NULL,
  seed = NULL,
  ncores = 1
)
```

**Arguments**

|         |   |
|---------|---|
| model   | homGP or hetGP model  |
| h       | horizon for multi-step ahead framework. The decision is made between: <ul style="list-style-type: none"> <li>• sequential crit search starting by a new design (optimized first) then adding h replicates</li> <li>• sequential crit searches starting by 1 to h replicates before adding a new point</li> </ul> Use $h = 0$ for the myopic criterion, i.e., not looking ahead.                           |
| Xcand   | optional discrete set of candidates (otherwise a maximin LHS is used to initialise continuous search)   |
| control | list in case Xcand == NULL, with elements multi.start, to perform a multi-start optimization based on <a href="#">optim</a> , with maxit iterations each. Also, tol_dist defines the minimum distance to an existing design for a new point to be added, otherwise the closest existing design is chosen. In a similar fashion, tol_diff is the minimum relative change of IMSPE for adding a new design. |
| Wijs    | optional previously computed matrix of Wijs, see <a href="#">Wij</a>  |
| seed    | optional seed for the generation of designs with <a href="#">maximinSA_LHS</a>  |
| ncores  | number of CPU available (> 1 mean parallel TRUE), see <a href="#">mclapply</a>  |

**Details**

The domain needs to be  $[0, 1]^d$  for now.

**Value**

list with elements:

- par: best first design,
- value: IMSPE h-steps ahead starting from adding par,
- path: list of elements list(par, value, new) at each step h

**References**

LOO\_preds

*Leave one out predictions*

---

### Description

Provide leave one out predictions, e.g., for model testing and diagnostics. This is used in the method plot available on GP and TP models.

### Usage

```
LOO_preds(model, ids = NULL)
```

### Arguments

|       |  |
|-------|--|
| model | homGP or hetGP model, TP version is not considered at this point         |
| ids   | vector of indices of the unique design point considered (default to all) |

### Value

list with mean and variance predictions at  $x_i$  assuming this point has not been evaluated

### Note

For TP models,  $\psi$  is considered fixed.

```

**Description**

Gaussian process regression when seed (or trajectory) information is provided, based on maximum likelihood estimation of the hyperparameters. Trajectory handling involves observing all times for any given seed.

**Usage**

```
mleCRNGP(
  X,
  Z,
  T0 = NULL,
  stype = c("none", "XS"),
  lower = NULL,
  upper = NULL,
  known = NULL,
  noiseControl = list(g_bounds = c(sqrt(.Machine$double.eps) * 10, 100), rho_bounds =
    c(0.001, 0.9)),
  init = NULL,
  covtype = c("Gaussian", "Matern5_2", "Matern3_2"),
  maxit = 100,
  eps = sqrt(.Machine$double.eps),
  settings = list(return.Ki = TRUE, factr = 1e+07)
)
```

**Arguments**

|              |  |
|--------------|--|
| X            | matrix of all designs, one per row. The last column is assumed to contain the integer seed value.  |
| Z            | vector of all observations. If ts is provided, the Z is a matrix of size nrow(X) x length(ts).   |
| T0           | optional vector of times (same for all Xs)   |
| stype        | structural assumptions, options include: <ul style="list-style-type: none"> <li>• none: no structure, regular matrix inversion is used (only when no time is present);</li> </ul> <p>When time is present, the Kronecker structure is always used (the alternative is to provide times as an extra variable in X) Using the Kronecker structure becomes efficient when the product (nx x ns) x nt becomes large.</p> |
| lower, upper | optional bounds for the theta parameter (see <a href="#">cov_gen</a> for the exact parameterization). In the multivariate case, it is possible to give vectors for bounds (resp. scalars) for anisotropy (resp. isotropy)  |
| known        | optional list of known parameters, e.g., beta0, theta, g or rho.   |
| noiseControl | list with element, <ul style="list-style-type: none"> <li>• g_bounds, vector providing minimal and maximal noise to signal ratio;</li> <li>• rho_bounds, vector providing minimal and maximal correlation between seed values, in [0,1];</li> </ul>  |

|                       |   |
|-----------------------|---|
| <code>init</code>     | optional list specifying starting values for MLE optimization, with elements: <ul style="list-style-type: none"> <li>• <code>theta_init</code> initial value of the theta parameters to be optimized over (default to 10% of the range determined with <code>lower</code> and <code>upper</code>)</li> <li>• <code>g_init</code> initial value of the nugget parameter to be optimized over.</li> <li>• <code>rho_init</code> initial value of the seed correlation parameter.</li> </ul> |
| <code>covtype</code>  | covariance kernel type, either 'Gaussian', 'Matern5_2' or 'Matern3_2', see <a href="#">cov_gen</a>  |
| <code>maxit</code>    | maximum number of iteration for L-BFGS-B of <a href="#">optim</a>   |
| <code>eps</code>      | jitter used in the inversion of the covariance matrix for numerical stability   |
| <code>settings</code> | list with argument <code>return.Ki</code> , to include the inverse covariance matrix in the object for further use (e.g., prediction). Arguments <code>factr</code> (default to $1e9$ ) and <code>pgtol</code> are available to be passed to control for L-BFGS-B in <a href="#">optim</a> .  |

### Details

The global covariance matrix of the model is parameterized as  $\text{nu\_hat} * (C_x + g \text{Id}) * C_s = \text{nu\_hat} * K$ , with  $C_x$  the spatial correlation matrix between unique designs, depending on the family of kernel used (see [cov\\_gen](#) for available choices) and values of lengthscale parameters.  $C_s$  is the correlation matrix between seed values, equal to 1 if the seeds are equal,  $\rho$  otherwise.  $\text{nu\_hat}$  is the plugin estimator of the variance of the process.

Compared to [mleHomGP](#), here the replications have a specific identifier, i.e., the seed.

### Value

a list which is given the S3 class "CRNGP", with elements:

- `theta`: maximum likelihood estimate of the lengthscale parameter(s),
- `g`: maximum likelihood estimate of the nugget variance,
- `rho`: maximum likelihood estimate of the seed correlation parameter,
- `trendtype`: either "SK" if `beta0` is given, else "OK"
- `beta0`: estimated trend unless given in input,
- `nu_hat`: plugin estimator of the variance,
- `ll`: log-likelihood value,
- `X0`, `S0`, `T0`: values for the spatial, seed and time designs
- `Z`, `eps`, `covtype`, `stype`,: values given in input,
- `call`: user call of the function
- `used_args`: list with arguments provided in the call
- `nit_opt`, `msg`: counts and msg returned by [optim](#)
- `Ki`: inverse covariance matrix (not scaled by `nu_hat`) (if `return.Ki` is TRUE in `settings`)
- `Ct`: if time is used, corresponding covariance matrix.
- `time`: time to train the model, in seconds.

### Note

This function is experimental at this time and could evolve in the future.

mleHetGP

*Gaussian process modeling with heteroskedastic noise*

---

## Description

Gaussian process regression under input dependent noise based on maximum likelihood estimation of the hyperparameters. A second GP is used to model latent (log-) variances. This function is enhanced to deal with replicated observations.

## Usage

```

mleHetGP(
  X,
  Z,
  lower = NULL,
  upper = NULL,
  noiseControl = list(k_theta_g_bounds = c(1, 100), g_max = 100, g_bounds = c(1e-06, 1)),
  settings = list(linkThetas = "joint", logN = TRUE, initStrategy = "residuals", checkHom
    = TRUE, penalty = TRUE, trace = 0, return.matrices = TRUE, return.hom = FALSE, factr
    = 1e+09),
  covtype = c("Gaussian", "Matern5_2", "Matern3_2"),
  maxit = 100,
  known = NULL,
  init = NULL,
  eps = sqrt(.Machine$double.eps)
)

```

## Arguments

- X matrix of all designs, one per row, or list with elements:
- X0 matrix of unique design locations, one point per row
  - Z0 vector of averaged observations, of length  $nrow(X0)$
  - mult number of replicates at designs in X0, of length  $nrow(X0)$

|              |  |
|--------------|--|
| Z            | vector of all observations. If using a list with X, Z has to be ordered with respect to X $\theta$ , and of length <code>sum(mult)</code>  |
| lower, upper | optional bounds for the theta parameter (see <a href="#">cov_gen</a> for the exact parameterization). In the multivariate case, it is possible to give vectors for bounds (resp. scalars) for anisotropy (resp. isotropy)  |
| noiseControl | list with elements related to optimization of the noise process parameters: <ul style="list-style-type: none"> <li>• <code>g_min</code>, <code>g_max</code> minimal and maximal noise to signal ratio (of the mean process)</li> <li>• <code>lowerDelta</code>, <code>upperDelta</code> optional vectors (or scalars) of bounds on Delta, of length <code>nrow(X<math>\theta</math>)</code> (default to <code>rep(eps, nrow(X<math>\theta</math>))</code> and <code>rep(noiseControl\$g_max, nrow(X<math>\theta</math>))</code>) resp., or their log)</li> <li>• <code>lowerTheta_g</code>, <code>upperTheta_g</code> optional vectors of bounds for the length-scales of the noise process if <code>linkThetas == 'none'</code>. Same as for theta if not provided.</li> <li>• <code>k_theta_g_bounds</code> if <code>linkThetas == 'joint'</code>, vector with minimal and maximal values for <code>k_theta_g</code> (default to <code>c(1, 100)</code>). See Details.</li> <li>• <code>g_bounds</code> vector for minimal and maximal noise to signal ratios for the noise of the noise process, i.e., the smoothing parameter for the noise process. (default to <code>c(1e-6, 1)</code>).</li> </ul>  |
| settings     | list for options about the general modeling procedure, with elements: <ul style="list-style-type: none"> <li>• <code>linkThetas</code> defines the relation between lengthscales of the mean and noise processes. Either 'none', 'joint'(default) or 'constr', see Details.</li> <li>• <code>logN</code>, when TRUE (default), the log-noise process is modeled.</li> <li>• <code>initStrategy</code> one of 'simple', 'residuals' (default) and 'smoothed' to obtain starting values for Delta, see Details</li> <li>• <code>penalty</code> when TRUE, the penalized version of the likelihood is used (i.e., the sum of the log-likelihoods of the mean and variance processes, see References).</li> <li>• <code>checkHom</code> when TRUE, if the log-likelihood with a homoskedastic model is better, then return it.</li> <li>• <code>trace</code> optional scalar (default to 0). If positive, tracing information on the fitting process. If 1, information is given about the result of the heterogeneous model optimization. Level 2 gives more details. Level 3 additionally displays all details about initialization of hyperparameters.</li> <li>• <code>return.matrices</code> boolean to include the inverse covariance matrix in the object for further use (e.g., prediction).</li> <li>• <code>return.hom</code> boolean to include homoskedastic GP models used for initialization (i.e., <code>modHom</code> and <code>modNugs</code>).</li> <li>• <code>factr</code> (default to 1e9) and <code>pgtol</code> are available to be passed to control for L-BFGS-B in <a href="#">optim</a>.</li> </ul> |
| covtype      | covariance kernel type, either 'Gaussian', 'Matern5_2' or 'Matern3_2', see <a href="#">cov_gen</a>   |
| maxit        | maximum number of iterations for L-BFGS-B of <a href="#">optim</a> dedicated to maximum likelihood optimization  |

|             |  |
|-------------|--|
| init, known | <p>optional lists of starting values for mle optimization or that should not be optimized over, respectively. Values in known are not modified, while it can happen to these of init, see Details. One can set one or several of the following:</p> <ul style="list-style-type: none"> <li>• theta lengthscale parameter(s) for the mean process either one value (isotropic) or a vector (anisotropic)</li> <li>• Delta vector of nuggets corresponding to each design in X0, that are smoothed to give Lambda (as the global covariance matrix depend on Delta and nu_hat, it is recommended to also pass values for theta)</li> <li>• beta0 constant trend of the mean process</li> <li>• k_theta_g constant used for link mean and noise processes lengthscales, when settings\$linkThetas == 'joint'</li> <li>• theta_g either one value (isotropic) or a vector (anisotropic) for lengthscale parameter(s) of the noise process, when settings\$linkThetas != 'joint'</li> <li>• g scalar nugget of the noise process</li> <li>• g_H scalar homoskedastic nugget for the initialisation with a <a href="#">mleHomGP</a>. See Details.</li> </ul> |
| eps         | jitter used in the inversion of the covariance matrix for numerical stability  |

### Details

The global covariance matrix of the model is parameterized as  $\nu_{\hat{}} * (C + \Lambda * \text{diag}(1/\text{mult})) = \nu_{\hat{}} * K$ , with C the correlation matrix between unique designs, depending on the family of kernel used (see [cov\\_gen](#) for available choices) and values of lengthscale parameters.  $\nu_{\hat{}}$  is the plugin estimator of the variance of the process. Lambda is the prediction on the noise level given by a second (homoskedastic) GP:

$$\Lambda = C_g(C_g + \text{diag}(g/\text{mult}))^{-1}\Delta$$

with C\_g the correlation matrix between unique designs for this second GP, with lengthscales hyperparameters theta\_g and nugget g and Delta the variance level at X0 that are estimated.

It is generally recommended to use [find\\_reps](#) to pre-process the data, to rescale the inputs to the unit cube and to normalize the outputs.

The noise process lengthscales can be set in several ways:

- using k\_theta\_g (settings\$linkThetas == 'joint'), supposed to be greater than one by default. In this case lengthscales of the noise process are multiples of those of the mean process.
- if settings\$linkThetas == 'constr', then the lower bound on theta\_g correspond to estimated values of an homoskedastic GP fit.
- else lengthscales between the mean and noise process are independent (both either anisotropic or not).

When no starting nor fixed parameter values are provided with init or known, the initialization process consists of fitting first an homoskedastic model of the data, called modHom. Unless provided with init\$theta, initial lengthscales are taken at 10% of the range determined with lower and

upper, while `init$g_H` may be use to pass an initial nugget value. The resulting lengthscales provide initial values for `theta` (or update them if given in `init`).

If necessary, a second homoskedastic model, `modNugs`, is fitted to the empirical residual variance between the prediction given by `modHom` at  $X_0$  and  $Z$  (up to `modHom$nu_hat`). Note that when specifying `settings$linkThetas == 'joint'`, then this second homoskedastic model has fixed lengthscale parameters. Starting values for `theta_g` and `g` are extracted from `modNugs`.

Finally, three initialization schemes for `Delta` are available with `settings$initStrategy`:

- for `settings$initStrategy == 'simple'`, `Delta` is simply initialized to the estimated `g` value of `modHom`. Note that this procedure may fail when `settings$penalty == TRUE`.
- for `settings$initStrategy == 'residuals'`, `Delta` is initialized to the estimated residual variance from the homoskedastic mean prediction.
- for `settings$initStrategy == 'smoothed'`, `Delta` takes the values predicted by `modNugs` at  $X_0$ .

Notice that lower and upper bounds cannot be equal for `optim`.

## Value

a list which is given the S3 class "hetGP", with elements:

- `theta`: unless given, maximum likelihood estimate (mle) of the lengthscales parameter(s),
- `Delta`: unless given, mle of the nugget vector (non-smoothed),
- `Lambda`: predicted input noise variance at  $X_0$ ,
- `nu_hat`: plugin estimator of the variance,
- `theta_g`: unless given, mle of the lengthscales of the noise/log-noise process,
- `k_theta_g`: if `settings$linkThetas == 'joint'`, mle for the constant by which lengthscales parameters of `theta` are multiplied to get `theta_g`,
- `g`: unless given, mle of the nugget of the noise/log-noise process,
- `trendtype`: either "SK" if `beta0` is provided, else "OK",
- `beta0` constant trend of the mean process, plugin-estimator unless given,
- `nmean`: plugin estimator for the constant noise/log-noise process mean,
- `ll`: log-likelihood value, (`ll_non_pen`) is the value without the penalty,
- `nit_opt`, `msg`: counts and message returned by `optim`
- `modHom`: homoskedastic GP model of class `homGP` used for initialization of the mean process,
- `modNugs`: homoskedastic GP model of class `homGP` used for initialization of the noise/log-noise process,
- `nu_hat_var`: variance of the noise process,
- `used_args`: list with arguments provided in the call to the function, which is saved in `call`,
- `Ki`, `Kgi`: inverse of the covariance matrices of the mean and noise processes (not scaled by `nu_hat` and `nu_hat_var`),
- `X0`, `Z0`, `Z`, `eps`, `logN`, `covtype`: values given in input,
- `time`: time to train the model, in seconds.

mleHetTP

*Student-t process modeling with heteroskedastic noise*

---

## Description

Student-t process regression under input dependent noise based on maximum likelihood estimation of the hyperparameters. A GP is used to model latent (log-) variances. This function is enhanced to deal with replicated observations.

## Usage

```

mleHetTP(
  X,
  Z,
  lower = NULL,
  upper = NULL,
  noiseControl = list(k_theta_g_bounds = c(1, 100), g_max = 10000, g_bounds = c(1e-06,
    0.1), nu_bounds = c(2 + 0.001, 30), sigma2_bounds = c(sqrt(.Machine$double.eps),
    10000)),
  settings = list(linkThetas = "joint", logN = TRUE, initStrategy = "residuals", checkHom
    = TRUE, penalty = TRUE, trace = 0, return.matrices = TRUE, return.hom = FALSE, factr
    = 1e+09),
  covtype = c("Gaussian", "Matern5_2", "Matern3_2"),
  maxit = 100,
  known = list(beta0 = 0),
  init = list(nu = 3),
  eps = sqrt(.Machine$double.eps)
)

```

**Arguments**

- X** matrix of all designs, one per row, or list with elements:
- $X_0$  matrix of unique design locations, one point per row
  - $Z_0$  vector of averaged observations, of length  $nrow(X_0)$
  - `mult` number of replicates at designs in  $X_0$ , of length  $nrow(X_0)$
- Z** vector of all observations. If using a list with  $X$ ,  $Z$  has to be ordered with respect to  $X_0$ , and of length  $sum(mult)$
- lower, upper** bounds for the theta parameter (see [cov\\_gen](#) for the exact parameterization). In the multivariate case, it is possible to give vectors for bounds (resp. scalars) for anisotropy (resp. isotropy)
- noiseControl** list with elements related to optimization of the noise process parameters:
- `g_min`, `g_max` minimal and maximal noise to signal ratio (of the mean process)
  - `lowerDelta`, `upperDelta` optional vectors (or scalars) of bounds on `Delta`, of length  $nrow(X_0)$  (default to  $rep(eps, nrow(X_0))$  and  $rep(noiseControl$g_max, nrow(X_0))$  resp., or their log)
  - `lowerTheta_g`, `upperTheta_g` optional vectors of bounds for the length-scales of the noise process if `linkThetas == 'none'`. Same as for `theta` if not provided.
  - `k_theta_g_bounds` if `linkThetas == 'joint'`, vector with minimal and maximal values for `k_theta_g` (default to  $c(1, 100)$ ). See Details.
  - `g_bounds` vector for minimal and maximal noise to signal ratios for the noise of the noise process, i.e., the smoothing parameter for the noise process. (default to  $c(1e-6, 1)$ ).
  - `sigma2_bounds`, vector providing minimal and maximal signal variance.
  - `nu_bounds`, vector providing minimal and maximal values for the degrees of freedom.
- settings** list for options about the general modeling procedure, with elements:
- `linkThetas` defines the relation between lengthscales of the mean and noise processes. Either `'none'`, `'joint'` (default) or `'constr'`, see Details.
  - `logN`, when TRUE (default), the log-noise process is modeled.
  - `initStrategy` one of `'simple'`, `'residuals'` (default) and `'smoothed'` to obtain starting values for `Delta`, see Details
  - `penalty` when TRUE, the penalized version of the likelihood is used (i.e., the sum of the log-likelihoods of the mean and variance processes, see References).
  - `checkHom` when TRUE, if the log-likelihood with a homoskedastic model is better, then return it.
  - `trace` optional scalar (default to 0). If positive, tracing information on the fitting process. If 1, information is given about the result of the heterogeneous model optimization. Level 2 gives more details. Level 3 additionally displays all details about initialization of hyperparameters.

See Details.</li> </ul> |
| <code>eps</code>         | jitter used in the inversion of the covariance matrix for numerical stability  |

## Details

The global covariance matrix of the model is parameterized as  $K = \sigma^2 * C + \Lambda * \text{diag}(1/\text{mult})$ , with  $C$  the correlation matrix between unique designs, depending on the family of kernel used (see [cov\\_gen](#) for available choices).  $\Lambda$  is the prediction on the noise level given by a (homoskedastic) GP:

$$\Lambda = C_g(C_g + \text{diag}(g/\text{mult}))^{-1} \Delta$$

with  $C_g$  the correlation matrix between unique designs for this second GP, with lengthscales hyperparameters `theta_g` and nugget `g` and `Delta` the variance level at  $X_0$  that are estimated.

It is generally recommended to use [find\\_reps](#) to pre-process the data, to rescale the inputs to the unit cube and to normalize the outputs.

The noise process lengthscales can be set in several ways:

- using `k_theta_g` (`settings$linkThetas == 'joint'`), supposed to be greater than one by default. In this case lengthscales of the noise process are multiples of those of the mean process.
- if `settings$linkThetas == 'constr'`, then the lower bound on `theta_g` correspond to estimated values of an homoskedastic GP fit.
- else lengthscales between the mean and noise process are independent (both either anisotropic or not).

When no starting nor fixed parameter values are provided with `init` or `known`, the initialization process consists of fitting first an homoskedastic model of the data, called `modHom`. Unless provided with `init$theta`, initial lengthscales are taken at 10% of the range determined with lower and upper, while `init$g_H` may be use to pass an initial nugget value. The resulting lengthscales provide initial values for `theta` (or update them if given in `init`).

If necessary, a second homoskedastic model, `modNugs`, is fitted to the empirical residual variance between the prediction given by `modHom` at  $X_0$  and  $Z$  (up to `modHom$nu_hat`). Note that when specifying `settings$linkThetas == 'joint'`, then this second homoskedastic model has fixed lengthscale parameters. Starting values for `theta_g` and `g` are extracted from `modNugs`.

Finally, three initialization schemes for `Delta` are available with `settings$initStrategy`:

- for `settings$initStrategy == 'simple'`, `Delta` is simply initialized to the estimated `g` value of `modHom`. Note that this procedure may fail when `settings$penalty == TRUE`.
- for `settings$initStrategy == 'residuals'`, `Delta` is initialized to the estimated residual variance from the homoskedastic mean prediction.
- for `settings$initStrategy == 'smoothed'`, `Delta` takes the values predicted by `modNugs` at  $X_0$ .

Notice that lower and upper bounds cannot be equal for `optim`.

## Value

a list which is given the S3 class "hetTP", with elements:

- `theta`: unless given, maximum likelihood estimate (mle) of the lengthscale parameter(s),
- `Delta`: unless given, mle of the nugget vector (non-smoothed),
- `Lambda`: predicted input noise variance at  $X_0$ ,
- `sigma2`: plugin estimator of the variance,
- `theta_g`: unless given, mle of the lengthscale(s) of the noise/log-noise process,
- `k_theta_g`: if `settings$linkThetas == 'joint'`, mle for the constant by which lengthscale parameters of `theta` are multiplied to get `theta_g`,
- `g`: unless given, mle of the nugget of the noise/log-noise process,
- `trendtype`: either "SK" if `beta0` is provided, else "OK",
- `beta0` constant trend of the mean process, plugin-estimator unless given,
- `nmean`: plugin estimator for the constant noise/log-noise process mean,
- `ll`: log-likelihood value, (`ll_non_pen`) is the value without the penalty,

- nit\_opt, msg: counts and message returned by `optim`
- modHom: homoskedastic GP model of class `homGP` used for initialization of the mean process,
- modNugs: homoskedastic GP model of class `homGP` used for initialization of the noise/log-noise process,
- nu\_hat\_var: variance of the noise process,
- used\_args: list with arguments provided in the call to the function, which is saved in `call`,
- $X_0$ ,  $Z_0$ ,  $Z$ , `eps`, `logN`, `covtype`: values given in input,
- time: time to train the model, in seconds.

| eps          | jitter used in the inversion of the covariance matrix for numerical stability   |
| settings     | list with argument return.Ki, to include the inverse covariance matrix in the object for further use (e.g., prediction). Arguments factr (default to 1e9) and pgtol are available to be passed to control for L-BFGS-B in <a href="#">optim</a> (for the joint likelihood only).  |

## Details

The global covariance matrix of the model is parameterized as  $\text{nu\_hat} * (C + g * \text{diag}(1/\text{mult})) = \text{nu\_hat} * K$ , with C the correlation matrix between unique designs, depending on the family of kernel used (see [cov\\_gen](#) for available choices) and values of lengthscale parameters. nu\_hat is the plugin estimator of the variance of the process.

It is generally recommended to use [find\\_reps](#) to pre-process the data, to rescale the inputs to the unit cube and to normalize the outputs.

**Value**

a list which is given the S3 class "homGP", with elements:

- theta: maximum likelihood estimate of the lengthscale parameter(s),
- g: maximum likelihood estimate of the nugget variance,
- trendtype: either "SK" if beta0 is given, else "OK"
- beta0: estimated trend unless given in input,
- nu\_hat: plugin estimator of the variance,
- ll: log-likelihood value,
- X0, Z0, Z, mult, eps, covtype: values given in input,
- call: user call of the function
- used\_args: list with arguments provided in the call
- nit\_opt, msg: counts and msg returned by `optim`
- Ki: inverse covariance matrix (not scaled by nu\_hat) (if return.Ki is TRUE in settings)
- time: time to train the model, in seconds.

```

---

mleHomTP

*Student-T process modeling with homoskedastic noise*

---

## Description

Student-t process regression under homoskedastic noise based on maximum likelihood estimation of the hyperparameters. This function is enhanced to deal with replicated observations.

## Usage

```

mleHomTP(
  X,
  Z,
  lower = NULL,
  upper = NULL,
  known = list(beta0 = 0),
  noiseControl = list(g_bounds = c(sqrt(.Machine$double.eps), 10000), nu_bounds = c(2 +
    0.001, 30), sigma2_bounds = c(sqrt(.Machine$double.eps), 10000)),
  init = list(nu = 3),
  covtype = c("Gaussian", "Matern5_2", "Matern3_2"),
  maxit = 100,
  eps = sqrt(.Machine$double.eps),
  settings = list(return.Ki = TRUE, factr = 1e+09)
)

```

## Arguments

- |   |  |
|---|--|
| X | matrix of all designs, one per row, or list with elements: <ul style="list-style-type: none"> <li>• X0 matrix of unique design locations, one point per row</li> <li>• Z0 vector of averaged observations, of length nrow(X0)</li> <li>• mult number of replicates at designs in X0, of length nrow(X0)</li> </ul> |
| Z | vector of all observations. If using a list with X, Z has to be ordered with respect to X0, and of length sum(mult)  |

|              |  |
|--------------|--|
| lower, upper | bounds for the theta parameter (see <a href="#">cov_gen</a> for the exact parameterization). In the multivariate case, it is possible to give vectors for bounds (resp. scalars) for anisotropy (resp. isotropy)   |
| known        | optional list of known parameters, e.g., beta0 (default to 0), theta, g, sigma2 or nu  |
| noiseControl | list with element, <ul style="list-style-type: none"> <li>• g_bound, vector providing minimal and maximal noise variance</li> <li>• sigma2_bounds, vector providing minimal and maximal signal variance</li> <li>• nu_bounds, vector providing minimal and maximal values for the degrees of freedom. The minimal value has to be strictly greater than 2. If the mle optimization gives a large value, e.g., 30, considering a GP with <a href="#">mleHomGP</a> may be better.</li> </ul>   |
| init         | list specifying starting values for MLE optimization, with elements: <ul style="list-style-type: none"> <li>• theta_init initial value of the theta parameters to be optimized over (default to 10% of the range determined with lower and upper)</li> <li>• g_init initial value of the nugget parameter to be optimized over (based on the variance at replicates if there are any, else 10% of the variance)</li> <li>• sigma2 initial value of the variance parameter (default to 1)</li> <li>• nu initial value of the degrees of freedom parameter (default to 3)</li> </ul> |
| covtype      | covariance kernel type, either 'Gaussian', 'Matern5_2' or 'Matern3_2', see <a href="#">cov_gen</a>   |
| maxit        | maximum number of iteration for L-BFGS-B of <a href="#">optim</a>  |
| eps          | jitter used in the inversion of the covariance matrix for numerical stability  |
| settings     | list with argument return.Ki, to include the inverse covariance matrix in the object for further use (e.g., prediction). Arguments factr (default to 1e9) and pgtol are available to be passed to control for L-BFGS-B in <a href="#">optim</a> .  |

## Details

The global covariance matrix of the model is parameterized as  $K = \text{sigma2} * C + g * \text{diag}(1/\text{mult})$ , with C the correlation matrix between unique designs, depending on the family of kernel used (see [cov\\_gen](#) for available choices).

It is generally recommended to use [find\\_reps](#) to pre-process the data, to rescale the inputs to the unit cube and to normalize the outputs.

## Value

a list which is given the S3 class "homGP", with elements:

- theta: maximum likelihood estimate of the lengthscale parameter(s),
- g: maximum likelihood estimate of the nugget variance,
- trendtype: either "SK" if beta0 is given, else "OK"
- beta0: estimated trend unless given in input,
- sigma2: maximum likelihood estimate of the scale variance,
- nu2: maximum likelihood estimate of the degrees of freedom parameter,

- ll: log-likelihood value,
- $X_0$ ,  $Z_0$ ,  $Z$ , mult, eps, covtype: values given in input,
- call: user call of the function
- used\_args: list with arguments provided in the call
- nit\_opt, msg: counts and msg returned by `optim`
- Ki, inverse covariance matrix (if return.Ki is TRUE in settings)
- time: time to train the model, in seconds.

|---------------|---|

---

## Description

Gaussian process predictions using a GP object for correlated noise (of class CRNGP)

## Usage

```

## S3 method for class 'CRNGP'
predict(object, x, xprime = NULL, t0 = NULL, ...)

```

## Arguments

|        |  |
|--------|--|
| object | an object of class CRNGP; e.g., as returned by <a href="#">mleCRNGP</a>  |
| x      | matrix of designs locations to predict at (one point per row). Last column is for the integer valued seed. If trajectories are considered, i.e., with time, the prediction will occur at the same times as the training data unless <code>t0</code> is provided. |
| xprime | optional second matrix of predictive locations to obtain the predictive covariance matrix between <code>x</code> and <code>xprime</code>   |
| t0     | single column matrix of times to predict at, if trajectories are considered. By default the prediction is at the same times as the training data.  |
| ...    | no other argument for this method  |

## Details

The full predictive variance corresponds to the sum of `sd2` and `nugs`. See [mleHomGP](#) for examples.

**Value**

list with elements

- mean: kriging mean;
- sd2: kriging variance (filtered, e.g. without the nugget value)
- cov: predictive covariance matrix between `x` and `xprime`
- nugs: nugget value at each prediction location, for consistency with [mleHomGP](#).

---

**Description**

Gaussian process predictions using a heterogeneous noise GP object (of class hetGP)

**Usage**

```
## S3 method for class 'hetGP'
predict(object, x, noise.var = FALSE, xprime = NULL, nugs.only = FALSE, ...)
```

**Arguments**

|           |  |
|-----------|--|
| object    | an object of class hetGP; e.g., as returned by <a href="#">mleHetGP</a>  |
| x         | matrix of designs locations to predict at (one point per row)  |
| noise.var | should the variance of the latent variance process be returned?  |
| xprime    | optional second matrix of predictive locations to obtain the predictive covariance matrix between <code>x</code> and <code>xprime</code> |
| nugs.only | if TRUE, only return noise variance prediction   |
| ...       | no other argument for this method.   |

**Details**

The full predictive variance corresponds to the sum of `sd2` and `nugs`. See [mleHetGP](#) for examples.

**Value**

list with elements

- mean: kriging mean;
- sd2: kriging variance (filtered, e.g. without the nugget values)
- nugs: noise variance prediction
- sd2\_var: (returned if `noise.var = TRUE`) kriging variance of the noise process (i.e., on log-variances if `logN = TRUE`)
- cov: (returned if `xprime` is given) predictive covariance matrix between `x` and `xprime`

### Description

Conditional simulation for CRNGP

### Usage

```
simul(object, Xgrid, ids, nsim, eps, seqseeds, check)
```

**Arguments**

|          |   |
|----------|---|
| object   | CRNGP model   |
| Xgrid    | matrix of (x, seed) locations where the simulation is performed. Where all design locations are matched with all seed values. In particular, it is assumed that each unique x values is matched with all seeds before going to the next x value. The last column <b>MUST</b> correspond to seeds values. Xgrid must also contain the evaluated designs (e.g., in model\$X0) |
| ids      | vector of indices corresponding to observed values in Xgrid   |
| nsim     | number of simulations to return   |
| eps      | jitter used in the Cholesky decomposition of the covariance matrix for numerical stability  |
| seqseeds | is the seed sequence repeated (e.g., 1 2 3 1 2 3), else it is assumed to be ordered (e.g., 1 1 2 2 3 3)   |
| check    | if TRUE, check that Xgrid has the proper structure (slower)   |

**Value**

Conditional simulation matrix.

---

simul.CRNGP

*Fast conditional simulation for a CRNGP model*

---

**Description**

Fast conditional simulation for a CRNGP model

**Usage**

```
## S3 method for class 'CRNGP'
simul(
  object,
  Xgrid,
  ids = NULL,
  nsim = 1,
  eps = sqrt(.Machine$double.eps),
  seqseeds = TRUE,
  check = TRUE
)
```

**Arguments**

|        |   |
|--------|---|
| object | a CRNGP model obtained with <a href="#">mleCRNGP</a>  |
| Xgrid  | matrix of (x, seed) locations where the simulation is performed. The last column <b>MUST</b> correspond to seeds values. Xgrid must also contain the evaluated designs (e.g., in object\$X0). All design locations are matched with all seed values, either by increasing seed values or repeating the seed sequence. |

|          |   |
|----------|---|
| ids      | vector of indices corresponding to observed values in Xgrid   |
| nsim     | number of simulations to return   |
| eps      | jitter used in the Cholesky decomposition of the covariance matrix for numerical stability              |
| seqseeds | is the seed sequence repeated (e.g., 1 2 3 1 2 3), else it is assumed to be ordered (e.g., 1 1 2 2 3 3) |
| check    | if TRUE, check that Xgrid has the proper structure (slower)   |

### Value

A matrix of size  $nrow(Xgrid) \times nsim$ .

sirEval                      *SIR test problem*

---

### Description

Epidemiology problem, initial and rescaled to  $[0,1]^2$  versions.

### Usage

```

sirEval(x)

sirSimulate(S0 = 1990, I0 = 10, M = S0 + I0, beta = 0.75, gamma = 0.5, imm = 0)

```

### Arguments

|                  |                                |
|------------------|--------------------------------|
| x                | vector of size two             |
| S0               | initial number of susceptibles |
| I0               | initial number of infected     |
| M                | total population               |
| beta, gamma, imm | control rates                  |

### References

 update.hetGP

 Update "hetGP"-class model fit with new observations
 

---

## Description

Fast update of existing hetGP model with new observations.

## Usage

```
## S3 method for class 'hetGP'
update(
  object,
  Xnew,
  Znew,
  ginit = 0.01,
  lower = NULL,
  upper = NULL,
  noiseControl = NULL,
  settings = NULL,
  known = NULL,
  maxit = 100,
  method = "quick",
  ...
)
```

## Arguments

|   |   |
|---|---|
| object                                      | previously fit "hetGP"-class model  |
| Xnew  | matrix of new design locations; ncol(Xnew) must match the input dimension encoded in object   |
| Znew  | vector new observations at those design locations, of length nrow(X). NAs can be passed, see Details  |
| ginit                                       | minimal value of the smoothing parameter (i.e., nugget of the noise process) for optimization initialization. It is compared to the g hyperparameter in the object. |
| lower, upper, noiseControl, settings, known | optional bounds for mle optimization, see <a href="#">mleHetGP</a> . If not provided, they are extracted from the existing model                                    |
| maxit                                       | maximum number of iterations for the internal L-BFGS-B optimization method; see <a href="#">optim</a> for more details  |
| method                                      | one of "quick", "mixed" see Details.  |
| ...   | no other argument for this method.  |

## Details

The update can be performed with or without re-estimating hyperparameter. In the first case, `mleHetGP` is called, based on previous values for initialization. The only missing values are the latent variables at the new points, that are initialized based on two possible update schemes in method:

- "quick" the new delta value is the predicted nugss value from the previous noise model;
- "mixed" new values are taken as the barycenter between prediction given by the noise process and empirical variance.

The subsequent number of MLE computations can be controlled with `maxit`.

In case hyperparameters need not be updated, `maxit` can be set to 0. In this case it is possible to pass NAs in `Znew`, then the model can still be used to provide updated variance predictions.

## Examples

```
##-----
## Sequential update example
##-----
set.seed(42)

## Spatially varying noise function
noisefun <- function(x, coef = 1){
  return(coef * (0.05 + sqrt(abs(x)*20/(2*pi))/10))
}

## Initial data set

update.homTP

*Fast homTP-update*

---

## Description

Update existing homTP model with new observations

**Usage**

```
## S3 method for class 'homTP'
update(
  object,
  Xnew,
  Znew = NULL,
  lower = NULL,
  upper = NULL,
  noiseControl = NULL,
  known = NULL,
  maxit = 100,
  ...
)
```

**Arguments**

|  |  |
|--|--|
| <code>object</code>  | initial model of class <code>homTP</code>  |
| <code>Xnew</code>  | matrix of new design locations; <code>ncol(Xnew)</code> must match the input dimension encoded in <code>object</code>                  |
| <code>Znew</code>  | vector new observations at those new design locations, of length <code>nrow(X)</code> . NAs can be passed, see <a href="#">Details</a> |
| <code>lower</code> , <code>upper</code> , <code>noiseControl</code> , <code>known</code> | optional bounds for MLE optimization, see <a href="#">mleHomTP</a> . If not provided, they are extracted from the existing model       |
| <code>maxit</code>   | maximum number of iterations for the internal L-BFGS-B optimization method; see <a href="#">optim</a> for more details                 |
| <code>...</code>   | no other argument for this method.   |

**Details**

In case hyperparameters need not be updated, `maxit` can be set to  $0$ . In this case it is possible to pass NAs in `Znew`, then the model can still be used to provide updated variance predictions.

**Examples**

```
## Not run:

|-----|--|

---

### Description

Compute double integral of the covariance kernel over a  $[0,1]^d$  domain

### Usage

```
Wij(mu1, mu2 = NULL, theta, type)
```

### Arguments

|          |   |
|----------|---|
| mu1, mu2 | input locations considered  |
| theta    | lengthscale hyperparameter of the kernel  |
| type     | kernel type, one of "Gaussian", "Matern5_2" or "Matern3_2", see <a href="#">cov_gen</a> |
